

Consistent and repeatable metrics for managing testing activities

Name Michal Jablonski

Abstract text What is testing? A time-consuming procedure or an integral part of the development process? Which metrics are important and how to assess code and tests quality? Ideally testing should help developers to create high quality software and not slow down the process. But when timing is crucial and new features have to be delivered as soon as possible we tend to

postpone testing. And even when we have a set of test cases often it is hard to execute them with every code iteration due to the run time. In the presentation I will explore which metrics should we focus on when testing software and what technics can help us make testing a vital part of the development rather than an unwanted and bothersome procedure.
